Continuous Triangular norm: Definition

A continuous trinagular norm (continuous *t*- norm, shortly) is a function $\star : [0, 1]^2 \rightarrow [0, 1]$ that safisfies the following properties:

- Commutativity: $x \star y = y \star x$
- Associativity: $(x \star y) \star z = x \star (y \star z)$
- Monotony: if $x \le y$ then $x \star z \le y \star z$
- Continuity

• □ > •

Fuzzy Logics associated to continuous t-norm

Each of the following *t*-norms is a natural representation of the *Conjunction* in the respective Logic

 $x \odot_P y = x \cdot y$ (Product t-norm) $x \odot y = \max\{x + y - 1, 0\}$ (Łukasiewicz t-norm) $x \odot_G y = \min\{x, y\}$ (Gödel t-norm)

We will represent (in a probabilistic way) these *t*-norms in the framework of Quantum Computation with mixed states.

・ロト ・ 日 ト ・ ヨ ト ・ ヨ ト

Sac

Łukasiewicz and Product *t*-norms are known for their relations with game theory applied to the theory of communication with feedback.

- Łukasiewicz t-norm is related to Ulam's games
- Product t-norm is specially applied in fuzzy control and allows us to model a probabilistic variant of Ulam's game, the so called Pelc's game

Standard Quantum Computation

Standard Quantum Computation is based on:

- qubit i.e. a pure state in \mathbb{C}^2
- Unitary operators (quantum gates)

(日)

> In general, a quantum system is not in a pure state (decoherence, environments, etc...). For this we need a powerfull model, where:

Quantum Computation with Mixed States

- Qubits are replaced by density operators
- Unitary operators are replaced by Quantum Operations

$$\mathcal{E}(\rho) = \sum_{i} A_{i} \rho A_{i}^{\dagger},$$

where A_i are operators satisfying $\sum_i A_i^{\dagger} A_i = I$ (Kraus representation)

イロト イポト イヨト イヨト

Recalling the Born rule, one can naturally define the probability-value of any density operator ρ of $\mathcal{H}^{(n)} = \otimes^n \mathbb{C}^2$.

Probability

For any $\rho \in \mathfrak{D}(\mathcal{H}^{(n)})$,

$$p(\rho) := Tr(P_1^{(n)}\rho),$$

where $\mathfrak{D}(\mathcal{H}^{(n)})$ is the set of all density operators of $\mathcal{H}^{(n)}$.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ◆ □ ▶

Logical overview

Conventionally, we can assume that the two elements $|1\rangle$ and $|0\rangle$ of the canonical orthonormal basis of the Hilbert space \mathbb{C}^2 represent the canonical truth-values *Truth* and *Falsity*.

Giuseppe Sergioli, Hector Freytes Fuzzy structures in Quantum Computation with mixed states

• □ ▶ • □ ▶ • □ ▶ • □ ▶

The notions of *truth*, *falsity* and *probability*:

True and false registers

•
$$|x_1, \ldots, x_n\rangle$$
 is a true register iff $|x_n\rangle = |1\rangle$;

•
$$|x_1, \ldots, x_n\rangle$$
 is a *false register* iff $|x_n\rangle = |0\rangle$.

In other words, the *truth-value* of a register is determined by its last element.

Truth and falsity

- ► The truth property of H⁽ⁿ⁾ is the projection operator P⁽ⁿ⁾₁ that projects over the closed subspace spanned by the set of all true registers.
- ► The falsity property of H⁽ⁿ⁾ is the projection operator P⁽ⁿ⁾₀ that projects over the closed subspace spanned by the set of all false registers.

Description of Entanglement The Holistic Conjunction Applying Holistic Conjunction to Werner and Isotropic States Representing Łukasiewicz (-norm Quantum computational logic: probabilistic approach

The Compositional Conjunction

Let ρ be a density operator of $\otimes^m \mathbb{C}^2$ and let σ be a density operator in $\otimes^k \mathbb{C}^2$. The *Compositional Conjunction* of ρ and σ is defined as follows:

$$AND^{(m,k)}(\rho \otimes \sigma) = {}^{\mathcal{D}}T^{(m,k,1)}(\rho \otimes \sigma \otimes P_0^{(1)})$$

where ${}^{\mathcal{D}}T^{(m,k,1)}$ is the "left-right" application of the Toffoli matrix. One can prove:

$$p(AND^{(m,k)}(\rho\otimes\sigma)) = p(\rho)p(\sigma).$$

AND probabilistically represents the Product *t*-norm.

Description of Entanglement The Holistic Conjunction Applying Holistic Conjunction to Werner and Isotropic States Representing Łukasiewicz /-norm Quantum computational logic: probabilistic approach

But in real cases the input of AND can be an unfactorized state!

This requires a new conjunction, called:

Holistic Conjunction

(日)

The Holistic Conjunction Applying Holistic Conjunction to Werner and Isotropic States Representing Łukasiewicz *t*-norm Quantum computational logic: probabilistic approach Definition of Entanglement The Schlienz-Mahler decomposition

Entanglement

The meaning of entanglement is strictly related to the principle of quantum non-separability.

Consider a density operator ρ of $\mathcal{H}^{a} \otimes \mathcal{H}^{b}$.

We say that ρ represents an *entangled state* iff ρ cannot be decomposed as a convex combination of density operators having the form: $\rho^a \otimes \rho^b$, with ρ^a density operator in \mathcal{H}^a and ρ^b density operator in \mathcal{H}^b . In other words:

 $\rho \neq \sum_{i} \lambda_{i} \rho_{i}$, where λ_{i} are positive real numbers such that $\sum_{i} \lambda_{i} = 1$ and ρ_{i} are density operators having the form: $\rho^{a} \otimes \rho^{b}$.

The Holistic Conjunction Applying Holistic Conjunction to Werner and Isotropic States Representing Łukasiewicz *t*-norm Quantum computational logic: probabilistic approach Definition of Entanglement The Schlienz-Mahler decomposition

Giuseppe Sergioli, Hector Freytes Fuzzy structures in Quantum Computation with mixed states

The Holistic Conjunction Applying Holistic Conjunction to Werner and Isotropic States Representing Łukasiewicz *t*-norm Quantum computational logic: probabilistic approach Definition of Entanglement The Schlienz-Mahler decomposition

Remark

Factorized states are only special cases of non-entangled states.

Example

Consider the state $|\psi^-\rangle = \frac{1}{\sqrt{2}}(|01\rangle - |10\rangle)$. Let $P_{|\psi^-\rangle}$ be the projection operator determined by $|\psi^-\rangle$ and let $I^{(2)}$ be the identity operator of $\mathcal{H}^{(2)}$.

Let
$$\rho = \frac{1}{3} P_{|\psi^{-}\rangle} + \frac{1}{6} I^{(2)}$$
.

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・

The Holistic Conjunction Applying Holistic Conjunction to Werner and Isotropic States Representing Łukasiewicz *t*-norm Quantum computational logic: probabilistic approach Definition of Entanglement The Schlienz-Mahler decomposition

Example

$$\rho = \begin{pmatrix} \frac{1}{6} & 0 & 0 & 0\\ 0 & \frac{1}{3} & -\frac{1}{6} & 0\\ 0 & -\frac{1}{6} & \frac{1}{3} & 0\\ 0 & 0 & 0 & \frac{1}{6} \end{pmatrix}$$

Even if ρ is not factorizable, ρ represents a non-entangled state!

Giuseppe Sergioli, Hector Freytes Fuzzy structures in Quantum Computation with mixed states

Werner States

Werner states

Let $\rho_W^{[n]}$ be a density matrix of a Hilbert space \mathcal{H} whose dimension is n^2 (with n > 1).

 $\rho_{W}^{[n]}$ is called a Werner State of \mathcal{H} iff, for any unitary operator U^{n} :

 $\rho_W^{[n]} = (U^n \otimes U^n) \rho_W^{[n]} ((U^n)^{\dagger} \otimes (U^n)^{\dagger}).$

Werner States

Parametrization of a Werner State

Werner states can be parametrized in different ways. One way is the following:

$$\rho_{W_{(\alpha)}}^{[n]} = \frac{n+1-2\alpha}{n(n^2-1)} I^{n^2} - \frac{n+1-2\alpha n}{n(n^2-1)} S w^{n^2}$$

where I^{n^2} is the $n^2 \times n^2$ identity matrix and Sw^{n^2} is the $n^2 \times n^2$ Switch gate, given by: $Sw^{n^2} = \sum_{i,j} (|i\rangle \langle j| \otimes |j\rangle \langle i|)$, where $|i\rangle$ and $|j\rangle$ are vectors of the *n*-dimensional computational basis and α is a real number such that $\alpha \in [0, 1]$.

(日)

Werner States

Theorem
Let
$$\rho_{W_{(\alpha)}}^{[n]}$$
 be a n^2 -dimensional Werner state. Then
i) $\rho_{W_{(\alpha)}}^{[n]}$ is **factorizable** iff $\alpha = \frac{n+1}{2n}$.
ii) $\rho_{W_{(\alpha)}}^{[n]}$ is **separable** iff $\frac{1}{2} \le \alpha \le 1$;

The real number α can be considered as related to a measure of entanglement (accordingly, the "degree of entanglement" of a Werner State is **inversely proportional** to α). When $\alpha = 0$, we can reasonably assume that $\rho_{W_{(\alpha)}}^{[n]}$ is **maximally entangled**.

• □ > •

Werner States

Theorem

Consider a Wernes State $\rho_{W_{(\alpha)}}^{[n]}$. By using the matrix representation of $\rho_{W_{(\alpha)}}^{[n]}$, we obtain: $p(AND_{Hol}^{(n,n)}(\rho_{W_{(\alpha)}}^{[n]})) = \frac{n^2 + n(2\alpha - 1) - 2}{4(n^2 - 1)};$

Polynomial quantum operation Representing Łukasiewicz sum Building a family of approximant for $x \oplus y$ The approximant and the error

In this language a polynomial of order k is a function

$$P(\mathbf{x}) = \sum_{|lpha| \leq k} a_{lpha} \mathbf{x}^{lpha} \quad s.t. \ a_{lpha} \in \mathbb{R}$$

Polynomial quantum operation **Representing Łukasiewicz sum** Building a family of approximant for $x \oplus y$ The approximant and the error

A problem

The convergence velocity by using Bernstein polynomial is low. It implies that: a good approximation need a high tensorial power. It is inefficient to implement in view of the fact that, it requires many copies of the involved states.

Polynomial quantum operation Representing Łukasiewicz sum Building a family of approximant for $x \oplus y$ The approximant and the error

Quantum computational logic: probabilistic approach

1. we introduce the auxiliary function

$$[0,2] \ni z \mapsto g(z) = \min(1,z)$$
 s.t. $x \oplus y = g(x+y)$

then the problem of approximating the bivariate function \oplus is changed into the easier problem of approximating the one-variable function g(z) in [0, 2].

2. By considering the function

$$[0,2] \ni z \mapsto h(z) = \begin{cases} \frac{z}{2}, & \text{if } x \in [0,1] \\ 1 - \frac{z}{2}, & \text{if } x \in (1,2] \end{cases}$$

3. We define

$$g(z)=\frac{z}{2}+h(z)$$

 h(z) is symmetric with respect to the point z = 1, i.e., h(2 - z) = h(z). For this reason we approximate h(z) by using the symmetric functions

$$z^i(2-z)^i$$

5.

$$g_n(z) = \frac{z}{2} + \sum_{i=1}^n c_i z^i (2-z)^i, \quad z \in [0,2]$$

6. The coefficients c_i are given by $\frac{-1^{i+1}}{2} \binom{1/2}{i}$

Fuzzy structures in Quantum Computation with mixed states

イロト イヨト イヨト イヨト ニヨー

Polynomial quantum operation Representing Łukasiewicz sum Building a family of approximant for $x \oplus y$ The approximant and the error

The approximant and the error

$$g_n(x+y) = \frac{x+y}{2} + \sum_{i=1}^n \frac{-1^{i+1}}{2} \binom{1/2}{i} (x+y)^i ((1-x) + (1-y))^i$$

We estimate a bound for the approximation error, in fact:

$$e_n = \max_{x,y \in [0,1]} |(x \oplus y) - g_n(x+y)| \le rac{1}{2\sqrt{\pi n}} + O(n^{-3/2})$$

---	--

Quantum computational logics with mixed states may be presented as a logic $\langle Term, \models \rangle$, where

- Term is an absolute free algebra (i.e. a language), whose natural universe of interpretation is a set D of density operators and whose connectives are naturally interpreted as certain quantum gates.
- canonical interpretations are Term-homomorphisms $e : Term \rightarrow D$.
- canonical valuations are functions $f : Term \rightarrow [0, 1]$ such that f can be factorized in the following way:

where *p* is the probability value $p(-) = tr(P_1 -)$.

 \models is the logical consequence,

$$\alpha \models \beta$$
 iff $p(\alpha) = 1 \implies p(\beta) = 1$

Giuseppe Sergioli, Hector Freytes Fuzzy structures in Quantum Computation with mixed states

MV-algebras

Standard MV-algebra PMV-algebras Axiomatizing the system ⟨⊕, IAND, NOT⟩ quasi MV-algebra quasi PMV-algebra and PMV-algebras A categorical result

An *MV-algebra* is an algebra $\langle A, \oplus, \neg, 0 \rangle$ of type $\langle 2, 2, 0 \rangle$ satisfying the following equations:

- MV1 $\langle A, \oplus, 0 \rangle$ is an abelian monoid,
- MV2 $\neg \neg x = x$,
- MV3 $x \oplus \neg 0 = \neg 0$,
- $\mathsf{MV4} \quad \neg(\neg x \oplus y) \oplus y = \neg(\neg y \oplus x) \oplus x.$

In agreement with the usual MV-algebraic operations we define:

$$\begin{aligned} x \odot y &= \neg (\neg x \oplus \neg y), & x \to y = \neg x \oplus y, & x \lor y = (x \to y) \to y \\ x \land y &= x \odot (x \to y), & 1 = \neg 0, \end{aligned}$$

A very important example of MV-algebra is

$$[0,1]_{\textit{MV}} = \langle [0,1], \oplus, \neg, 0 \rangle$$

such that [0, 1] is the real unit segment and \oplus and \neg are defined as follows:

$$x \oplus y = \min(1, x + y)$$
 $\neg x = 1 - x$

The derivate operations in $[0, 1]_{MV}$ are given by

1.
$$x \odot y = \max(0, x + y - 1)$$
 (*Łukasiewicz t-norm*)

2. $x \rightarrow y = \min(1, 1 - x + y)$ (Łukasiewicz implication)

MV-algebras Standard MV-algebra PMV-algebras Axiomatizing the system ⟨⊕, IAND, NOT⟩ quasi MV-algebra quasi PMV-algebra and PMV-algebras A categorical result

Question

What is the algebra associated to $\langle \mathcal{D}, \oplus, IAND, NOT, \frac{1}{tr(P_0)}P_0 \rangle$?

- ► This algebra describes the combinational logic of the quantum gates (⊕, IAND, NOT).
- It plays a similar role that Boolean algebra describing the combinational logic for digital circuits.

э.

The first and more basic algebraic structure associated to $\langle \oplus, NOT \rangle$ is the *quasi MV-algebra* or *qMV*-algebra for short. It is an algebra $\langle A, \oplus, \neg, 0, 1 \rangle$ of type $\langle 2, 1, 0, 0 \rangle$ satisfying the following equations:

Q1.
$$x \oplus (y \oplus z) = (x \oplus y) \oplus z$$
,

Q2.
$$\neg \neg x = x$$
,

Q3. $x \oplus 1 = 1$,

Q4.
$$\neg(\neg x \oplus y) \oplus y = \neg(\neg y \oplus x) \oplus x$$
,

Q5. $\neg(x\oplus 0) = \neg x\oplus 0$,

Q6.
$$(x \oplus y) \oplus 0 = x \oplus y$$
,

Q7. $\neg 0 = 1$.

From an intuitive point of view, a *qMV*-algebra can be seen as an *MV*-algebra which fails to satisfy the equation $x \oplus 0 = x$.

MV-algebras Standard MV-algebra PMV-algebras Axiomatizing the system ⟨⊕, IAND, NOT⟩ quasi MV-algebra quasi PMV-algebra and PMV-algebras A categorical result

Let A be a quasi PMV-algebra

- $a \equiv_0 b$ iff $a \oplus 0 = b \oplus 0$ is a congruence in A
- A/\equiv_0 is a *PMV*-algebra
- If A is a set of density operators

$$\equiv_0 = Ker(p)$$
 where $p(-) = tr(P_1(-))$

Note that

The natural projection $\pi : A \to A/\equiv_0$ is the abstract description of the probability $p(-) = tr(P_1(-))$
